Internships in Computer Science

There are many students on this campus who go home in mid-May only to find that life at home with Mom and Dad just isn't as much fun as they thought it'd be. If they're working at all, many of these students are working at day-camps or construction sites. Somehow, Camp Tonawanga doesn't seem like a place for a computer science major to get some good experience for the future. You may ask, "Where can I get this experience?" The answer is summer internships.

Every week, the Engineering Placement Office puts out a bulletin with a list of employers who are specifically looking for summer interns. The list contains employers from all over the country, and even a few overseas. There are internships for people in all engineering curriculums, including Computer Science.

You may now ask, "What do I have to do?" This part is even easier. Simply go through the list and find the employers that you like. In with

the job description, there were either be an address to which you should mail a cover letter and resumé, or it will say "place resumé in mailbox by such-and-such." There is a large bin of mailboxes just outside of EPO just for this purpose. Find the mailbox with the name of your company, slide a resumé in, and you're all set... well, almost.

This whole process looks really simple, but you still haven't gotten an internship. The real task involved in getting an internship or any job is going after the job that you want. A contact person is listed for every company. If you don't hear from a company in a couple weeks, send this person a letter! If they hear from you, it will show them that you are really interested in working for them, and they should take a close look at you. Don't be afraid to call up and say, "I haven't heard anything in a few weeks, I was just wondering how things are progressing."

Law, Ethics, and Computer Science

Part II: Intellectual Property

An important disclaimer: I am not a lawyer. While I believe the legal opinions I write in this column to be correct, they are nevertheless a layman's view of the law. If you have important legal questions, you should discuss them with a lawyer.

Many areas of computer science are affected by intellectual property law. Intellectual property is property whose value lies not in a physical object but in its ideas or expression. It is also commonly property which could easily be duplicated (unlike physical property).

Examples of intellectual property include the content of books, patents, software, music, and trademarks. There are three common means of protecting intellectual property relevant to computer science: copyrights, patents, and contracts. These will be discussed in this

column; later columns will deal with issues and applications of each of these areas.

Copyright law is concerned with the right to copy a specific work of intellectual property. Copyrights protect the copyright holder's right to control the copying of their work for 75 years; they also protect so-called "moral rights", such as the right to claim authorship of a given work. The copyright law was changed in 1990 so that works are now copyrighted by default (before 1990, works not explicitly copyrighted were in the public domain). While an explicit copyright notice and proof of authorship are useful, anything written is now automatically copyrighted by the author. Copyrights can be granted on a concrete expression, but not on an idea,

Not Paid For By SORF...

The Student Organization Resource Fee committee has decided to keep this University back in the stone ages. For those of you who don't know, the SORF board determines how much of **your** student resource fee money to give to each registered student organization on campus. This semester, the SORF board has chosen to give ACM next to nothing. Well, actually we received \$100 to use for communications. This minute sum would barely pay for two DI ads!!! ACM has budgeted approximately \$17,000 in expenditures for this year, and you can see how much this means to the SORF board. They are going to fund less than 1% of ACM's needs for the year! We have a gap of nearly \$2000 for this semester alone in the amount of funding we receive from the computer science department, fund raising, and membership dues.

After seeing the SORF allocation process in action, it baffles me how it can survive as it is. Each organization that submits an application for funding is interviewed by a small panel. A few questions are asked about the funding application and then the meeting is over. The people in this sub-committee are then expected to answer any questions that the SORF board has about the application. This can easily allow personal bias into the system as well as just plain ignorance of what the group is asking for and why it may be so desperately needed. It is difficult enough for the actual leaders of an organization to justify every one of their expenditures, let alone someone who's only knowledge of the group comes from a

5 minute interview. Added to this is the apparent disorganized nature of the SORF board.

We requested to speak before the SORF board itself, knowing that ACM needed to clarify our expenditures to the board directly. We were told that we would be notified before the meeting, so that we could attend. Well, after calling a week or so later, it turned out that the board had already made its decisions for our funding, without ever notifying us of the meeting. Pointing this out as soon as

From the Chair

we learned about it, we were informed that the recommended funding could only be changed if we submitted a request for reconsideration, even if a mess-up like this had been made. This means that we will have to argue with the board and tell them that their initial allocation was wrong, and that we deserve more. Trying to change a decision that was based on wrong or misleading information will be very difficult, but we have no choice but to try.

Realizing that each student on campus has paid a \$5 SORF fee, and even assuming that each member of ACM is a member of another organization, that works out to over \$600 that should be

earmarked for ACM. In previous semesters, we have applied for sums of \$5-900 and received about half that each time. The money for this semester was budgeted for new reference material for our library, subscriptions to popular computing magazines and journals, computer software for our lab, an IBM compatible computer for software development and many other items that our organization desperately needs to meet the demands of our growing membership. With the tiny sum of money appropriated to ACM for this semester, we will have to cut back the events and services that we offer our members.

I wish that there was an easy way to change this situation, but unfortunately, there isn't. We are following 'proper channels' to make sure that we do everything within our rights as a student organization to obtain funding. I want to recommend that everyone collect their SORF refund, donate it to ACM, and tell the board how disgusted we are with this situation, but that would not be fair to other organizations, so please don't. You can be sure that we will not let these mistakes continue. When you see familiar names on the ballot for the SORF board in next year's election, please support them.

It is unfortunate that a group which really decides the fate of most registered student organizations on this campus can be run so poorly and make such misinformed decisions.
